# Ashmit Sethi

Berkeley, CA — 408-332-6048 — ashmit@berkeley.edu — linkedin.com/in/ashmitsethi — github.com/asxhz — Portfolio Site

## Education

**University of California Berkeley** **Expected Graduation: May 2028**
*Bachelor of Arts in Data Science and Applied Math*
***Course Work:*** *DSA, OOP, Linear Algebra, Data Science, Statistics, Data Visualization, Data Decisions*

## Skills

**Languages** Python, Java, TypeScript, JavaScript, SQL
**Frontend** React, Next.js, HTML/CSS
**Backend** FastAPI, Spring Boot, Django, Flask, REST
**Databases** PostgreSQL, MongoDB, Redis
**ML/AI** PyTorch, scikit-learn, Pandas, NLP, CV
**Generative AI** LLMs, Agentic AI, RAG, MCP, Fine-tuning
**Cloud/Infra** AWS (Lambda, EC2, S3), Docker, Kubernetes
**DevOps/Tools** Git, CI/CD, Linux, Jira, Agile

## Experience

**Member of Technical Staff Intern** **May 2026 – July 2026**
*Tash. (YC S26)* *San Francisco, CA*
- Built backend services and user workflows for a trading-card investment and marketplace platform, supporting portfolio ownership, card listings, payments, order management, and vaulted inventory.
- Automated card ingestion, fulfillment, shipping, tracking, and notifications, expanding platform inventory by **7,500+** cards per day and improving shipping reliability by more than **60%**.
- Engineered idempotent payment flows, order state machines, retry systems, and internal operations tools, reducing manual intervention by **80%** across marketplace and investment workflows.

**AI/Data Engineer Intern** **Apr 2026 – May 2026**
*Enact Insight* *Berkeley, CA*
- Built and deployed a production facial-recognition pipeline indexing **12,000+** actors, scraping and preprocessing reference images, and identifying faces in video through embedding-based similarity search.
- Achieved **99%** recognition accuracy in an internal test run across variations in resolution, face size, lighting, viewing angle, pose, and partial occlusion affecting different facial regions.
- Productionized image collection, preprocessing, similarity-threshold calibration, and performance monitoring to maintain reliable recognition across inconsistent real-world video inputs.

**Engineering Intern** **Jan 2026 - Apr 2026**
*Apocor* *Berkeley, CA*
- Shipped **15+** core BaaS features across onboarding, authentication, payments, account management, and transaction workflows, simplifying API usage and reducing customer setup time by **40%**.
- Optimized API request handling and authentication infrastructure, improving overall API performance by **20%** while increasing authorization speed and validation accuracy.
- Built custom features for fintech pilot programs, resolved production bugs, and improved documentation, error handling, and integration workflows to make the platform easier for customers to adopt and operate.

**Machine Learning Research Assistant** **May 2024 – Aug 2024**
*Indiana University Bloomington & University of Texas at San Antonio* *San Jose, CA*
- Conducted medical-domain LLM research across **1,200+** annotated samples, supporting PyTorch training, prompt optimization, and data-augmentation experiments for domain-specific language generation.
- Implemented and evaluated **750+** Python classification experiments for counterfactual fairness, benchmarking accuracy, robustness, and bias metrics to reduce measured model disparity by **40%**

## Projects

**CTO - Gether – Fintech card company that lets you spend using any asset (Launching Sep 2026)** **Link**
- Created a full-stack card platform, entering pilot launch with real cardholders, developing the consumer app, real-time authorization infrastructure, and an ML-based loan-to-value model that uses portfolio risk and market data to let users safely spend against stocks, crypto, and cash without selling or incurring a tax.

**Multimodal Agentic AI Desktop Operator — 1st Place Winner at Cal Hacks 12.0 (ElevenLabs)** **Link**
- Built an end-to-end multimodal desktop agent combining LLM planning, real-time computer vision, voice interaction, GUI automation, and tool calling to interpret screen context, autonomously execute multi-step workflows across applications, and dynamically replan actions based on visual feedback and execution failures.
